

- I chose relationship between Customers and Tickets because 1 customer can purchase multiple tickets and the ticket has the customer_id so we can assign each ticket to the correct customer
- Between Movies and Show_Times and Theaters: each movie will play in different theaters location, also each movie has different show time
- For Consessions and Consession_Sales: each customer can purchase multiple consessions, so with the Foreign Key customer_id, we can assign exactly what customer purchased correctly. Also, consession_it is included in there to help recognize what consession was bought
